$C = -6$ gap in domain and walls

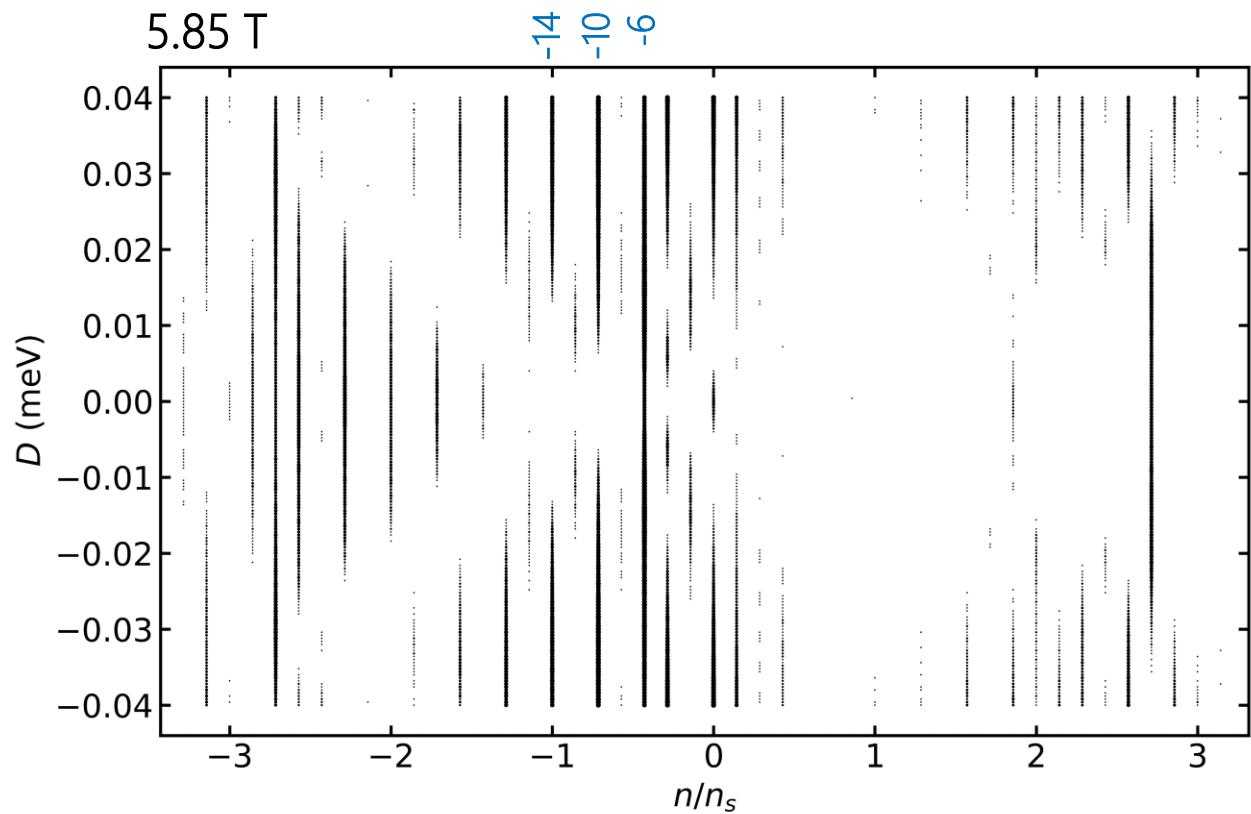

$C = -6$ gap in domain and walls

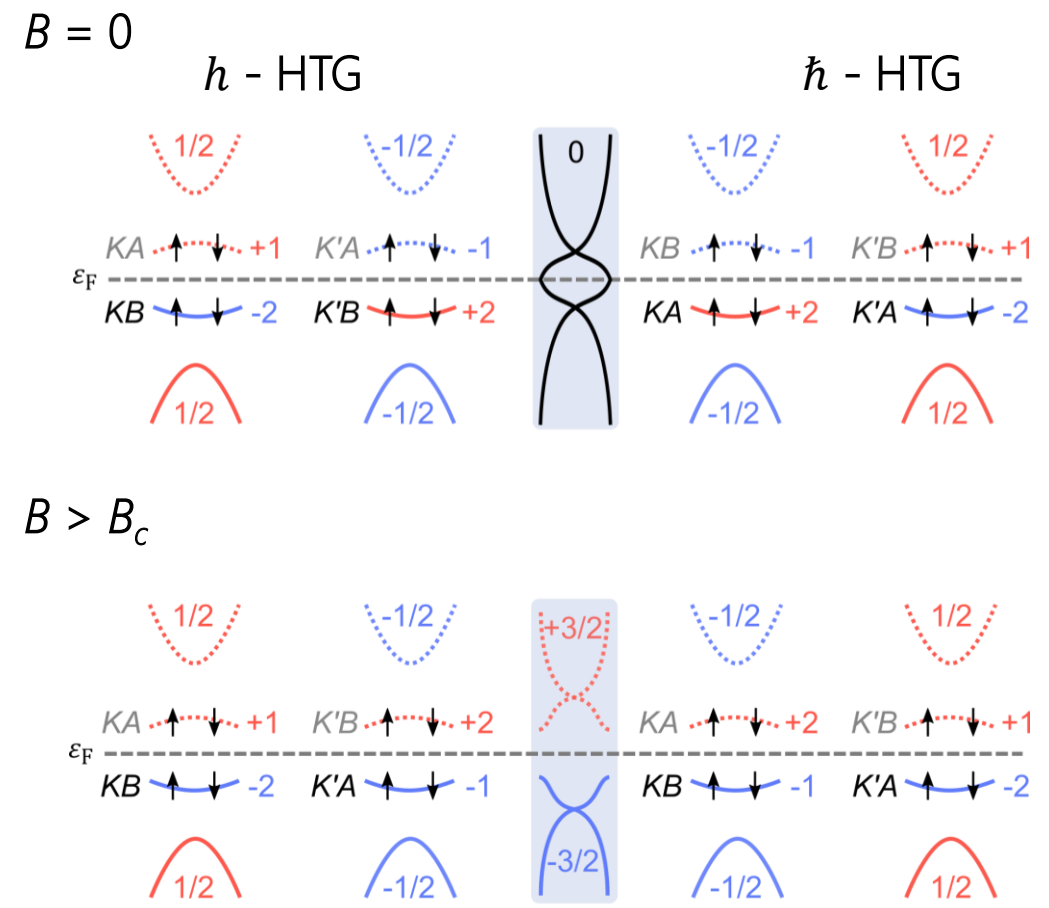

Layer potential dependences of Hofstadter gaps

Layer potential dependences of Hofstadter gaps

- HTG is a new moiré platform for topological bands
 - Local Chern domains related by C_{2z}
- Chern insulator induced by a small B field
 - Quantization requires understanding the supermoiré
 - $C=-6$ Chern insulator understandable by both strong coupling and Hofstadter
